## Variable References (CASE MATTERS):

### Strings

String can contain any commonly used character EXCEPT for spaces (“ ”), tabs/indentations (“\t”), new lines (“\n”), and **PIPES** (“|”).

### Booleans

The string representation for booleans must be any of the following:

true  
false

### Gender Enums

The string representation for Gender enums must be any of the following:

MALE  
FEMALE  
NONBINARY

### Role Enums

The string representation for Role enums must be any of the following:

RA  
REA  
REC

### Hall Enums

The string representation for Hall enum must be any of the following:

/\* All Male \*/  
CARY  
MCCUTCHEON  
TARKINGTON

/\* All Female \*/  
MEREDITH

MEREDITH\_SOUTH  
WINDSOR

/\* Co-Ed \*/  
EARHART  
FIRST\_STREET\_TOWERS  
FRIEDA\_PARKER  
WINIFRED\_PARKER  
HARRISON  
HAWKINS  
HILLENBRAND  
HONORS\_COLLEGE  
OWEN  
SHREVE  
WILEY

/\* Apartments \*/  
URBA

### **DutyLevel Enums**

The string representation for DutyLevel enums must be any of the following:

/\* For Shifts Only\*/  
PRIMARY  
SECONDARY  
TERTIARY

/\* For events \*/  
null

### **Time Zones**

The string representation for time zones is any integer representing the number of hours away from UTC:

Integer from [-12, 14] inclusive (default is 0).

### **Dates**

Any dates related times such as day, month, or year are any valid integer as seen on a calendar

day: Integer from [1, 31]\* inclusive (\* depending on the month).

month: Integer from [1, 12] inclusive.

year: Integer from [2024, INTEGER\_MAX - 1] inclusive.

## Resident Assistant Links

<http://localhost:8080/ra/{id}>

### ***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

### ***Output:***

Returns RA information as a string with string in JSON formatting, as seen below.

```
{
  "name" : "...",
  "email" : "...",
  "id" : "...",
  "gender" : "...",
  "role" : "...",
  "hall" : "...",
  "enabled" : "...",
  "timezone" : "...",
  "floor" : "...",
  "clockedIn" : "..."
}
```

<http://localhost:8080/ra/{id}/delete>

### ***Input:***

The “id” associated with the RA. This is included in the link for the desired RA to be deleted.

### ***Output:***

Deletes the RA with the given id. Returns string with the message:

“Deleted User: [id]”

**http://localhost:8080/ra/{id}/set-name**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The “name” to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "name" : "..."  
}
```

***Output:***

Changes the name of the RA with the given id. Returns string with the message:

“Name Edited”

**http://localhost:8080/ra/{id}/set-email**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The “email” to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "email" : "..."  
}
```

***Output:***

Changes the email of the RA with the given id. Returns string with the message:

“Email Edited”

**http://localhost:8080/ra/{id}/set-gender**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The “gender” to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  “gender” : “...”  
}
```

***Output:***

Changes the gender of the RA with the given id. Returns string with the message:

“Gender Edited”

**http://localhost:8080/ra/{id}/set-hall**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The “hall” to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  “hall” : “...”  
}
```

***Output:***

Changes the hall of the RA with the given id. Returns string with the message:

“Hall Edited”

<http://localhost:8080/ra/{id}/enable>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Enables the account of the RA with the given id.

<http://localhost:8080/ra/{id}/disable>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Disables the account of the RA with the given id.

<http://localhost:8080/ra/{id}/set-floor>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The “floor” to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{
  "floor" : "...
}
```

***Output:***

Changes the floor of the RA with the given id. Returns string with the message:

“Floor Edited”

<http://localhost:8080/ra/{id}/set-timezone>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The “timezone” to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "timezone" : "..."  
}
```

***Output:***

Changes the floor of the RA with the given id. Returns string with the message:

“Timezone Edited”

<http://localhost:8080/ra/{id}/set-all>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

All basic attributes to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{
  "name" : "...",
  "email" : "...",
  "gender" : "...",
  "hall" : "...",
  "enabled" : "...",
  "floor" : "..."
}
```

***Output:***

Sets basic attributes RA with the given id. Returns string with the message:

“Basic Attributes Set”

**http://localhost:8080/ra/{id}/create-account**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

Minimum number of attributes to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "name" : "...",  
  "email" : "...",  
  "enabled" : "..."  
}
```

***Output:***

Sets minimum number of attributes to create an RA account with the given id. Returns string with the message:

“Basic Attributes Set”

**http://localhost:8080/ra/{id}/clock-in**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Clocks in the RA with the given id. Returns string with the message:

“Clocked In”

**http://localhost:8080/ra/{id}/clock-out**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Clocks out the RA with the given id. Returns string with the message:

“Clocked Out”

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Clocks out the RA with the given id. Returns string with the message:

“Clocked Out”

**http://localhost:8080/ra/{id}/clear-preferences**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Clears list of preferences for RA with the given id. Returns string with the message:

“Preferences Cleared”

**http://localhost:8080/ra/{id}/add-preference**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

String called “preference” to be added for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  “preference” : “...”  
}
```

***Output:***

Sets basic attributes RA with the given id. Returns string with the message:

“Preference Added”

**http://localhost:8080/ra/{id}/get-preferences**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Sets basic attributes RA with the given id. Returns string array with the preferences formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{  
  “preference” : “...”  
}
```

<http://localhost:8080/ra/{id}/get-events>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Returns all the events of the RA with the given id. Returns string array with the events formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "..."
}
```

<http://localhost:8080/ra/{id}/get-shifts>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Returns all the shifts of the RA with the given id. Returns string array with the shifts formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
}
```

<http://localhost:8080/ra/{id}/get-meetings>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

***Output:***

Returns all the meetings of the RA with the given id. Returns string array with the shifts formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "..."
}
```

<http://localhost:8080/ra/{id}/delete-event/{eventId}>

***Input:***

The “id” associated with the RA as well as the “eventId” of the event to be deleted. These are included in the link for the desired RA.

***Output:***

Deletes event with the given eventId in the RA with the given id.  
Returns string with the message:

“Deleted: [eventId]”

**http://localhost:8080/ra/{id}/delete-event-day**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The starting “day” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{  
  "day" : "..."  
  "month" : "..."  
  "timezone" : "..."  
}
```

***Output:***

Deletes events on starting day in the RA with the given id. Returns string with the message:

“Deleted Day”

<http://localhost:8080/ra/{id}/delete-event-week>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The starting “day” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “year” of the starting day events to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{
"day" : "...
"month" : "...
"year" : "...
"timezone" : "...
}
```

***Output:***

Deletes all events up until a week after the starting day in the RA with the given id. Returns string with the message:

“Deleted Week”

**http://localhost:8080/ra/{id}/delete-event-month**

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “year” of the starting day events to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{
"month" : "...
"year" : "...
"timezone" : "...
}
```

***Output:***

Deletes all events for the entire month day in the RA with the given id. Returns string with the message:

“Deleted Month”

<http://localhost:8080/ra/{id}/edit-event/{eventId}/edit-title>

***Input:***

The “id” associated with the RA. The “eventId” to have its title edited. This is included in the link for the desired RA.

The new “title” to be used in the current event for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "title" : "..."  
}
```

***Output:***

Changes the title of the given event belonging to the RA with the given id. Returns string with the message:

“Edited Title: [title]”

<http://localhost:8080/ra/{id}/edit-event/{eventId}/edit-description>

***Input:***

The “id” associated with the RA. The “eventId” to have its description edited. This is included in the link for the desired RA.

The new “description” to be used in the current event for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "description" : "..."  
}
```

***Output:***

Changes the description of the given event belonging to the RA with the given id. Returns string with the message:

“Edited Description: [description]”

<http://localhost:8080/ra/{id}/edit-event/{eventId}/edit-duty-level>

***Input:***

The “id” associated with the RA. The “eventId” to have its duty level edited. This is included in the link for the desired RA.

The new “dutyLevel” to be used in the current event for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "dutyLevel" : "..."  
}
```

***Output:***

Changes the duty level of the given event belonging to the RA with the given id. Returns string with the message:

“Edited Description: [dutyLevel]”

<http://localhost:8080/ra/{id}/add-event/{eventId}>

***Input:***

The “id” associated with the RA. The “eventId” to be added. This is included in the link for the desired RA.

The new event to be added for the current RA. This is given as a string in JSON formatting, as seen below.

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
  "endMinute" : "...",
  "endMonth" : "...",
  "endDay" : "...",
  "endYear" : "...",
  "endTimezone" : "...",
  "dutyLevel" : "...",
  "availability" : "..."
}
```

***Output:***

Outputs all the current events belonging to the RA with the given id. Returns string with the message:

For String[0], ..., String[n] =>

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
```

```
"endMinute" : "...",  
"endMonth" : "...",  
"endDay" : "...",  
"endYear" : "...",  
"endTimezone" : "...",  
"dutyLevel" : "...",  
"availability" : "..."  
}
```

<http://localhost:8080/ra/{id}/add-shift/{eventId}>

***Input:***

The “id” associated with the RA. The “eventId” to be added. This is included in the link for the desired RA.

This function assumes that this RA has already been assigned an REA.

***Output:***

Outputs all the current shifts belonging to the RA with the given id. This is given as a string in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
  "endMinute" : "...",
  "endMonth" : "...",
  "endDay" : "...",
  "endYear" : "...",
  "endTimezone" : "...",
  "dutyLevel" : "...",
  "availability" : "..."
}
```

<http://localhost:8080/ra/{id}/request-drop/{eventId}>

***Input:***

The “id” associated with the RA. The “eventId” to be added. This is included in the link for the desired RA.

This adds a drop request to the assigned REA to request a shift with the “eventId” to be dropped.

**Output:**

Outputs all the current shifts belonging to the RA with the given id.  
Returns string formatted as a JSON:

For String[0], ..., String[n] =>

```
{
"title" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"endHour" : "...",
"endMinute" : "...",
"endMonth" : "...",
"endDay" : "...",
"endYear" : "...",
"endTimezone" : "...",
"dutyLevel" : "...",
"availability" : "..."
}
```

<http://localhost:8080/ra/{id}/request-drop-delete/{eventId}>

***Input:***

The “id” associated with the RA. The “eventId” to be added. This is included in the link for the desired RA.

This removes a drop request of an “eventId” to the assigned REA that was requested to be dropped.

***Output:***

Outputs all the current shifts belonging to the RA with the given id. Returns string with the message:

For String[0], ..., String[n] =>

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
  "endMinute" : "...",
  "endMonth" : "...",
  "endDay" : "...",
  "endYear" : "...",
  "endTimezone" : "...",
  "dutyLevel" : "...",
  "availability" : "..."
}
```

<http://localhost:8080/ra/{id}/find-ra-in-hall>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{  
  "hall" : "..."  
}
```

***Output:***

Returns an array of the RA ids that match the given hall.  
This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{  
  "raId" : "..."  
}
```

<http://localhost:8080/ra/{id}/find-rea-in-hall>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{
  "hall" : "...
}
```

***Output:***

Returns an array of the REA ids that match the given hall.  
This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{
  "reaId" : "...
}
```

<http://localhost:8080/ra/{id}/find-rec-in-hall>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{
  "hall" : "...
}
```

***Output:***

Returns an array of the REC ids that match the given hall. This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{
  "recId" : "...
}
```

<http://localhost:8080/ra/{id}/report-ra/{raId}>

***Input:***

The “id” associated with the RA. The new “raId” to be reported. These are included in the link for the desired RA.

***Output:***

Reports the RA with the raId from the RA with the given id. Returns string with the message:

“RA Id: [raId] Reported”

<http://localhost:8080/ra/{id}/report-rea/{reaId}>

***Input:***

The “id” associated with the RA. The new “reaId” to be reported. These are included in the link for the desired RA.

***Output:***

Reports the REA with the reaId from the RA with the given id. Returns string with the message:

“REA Id: [reaId] Reported”

## Resident Education Assistant Links

<http://localhost:8080/rea/{id}/delete>

### *Input:*

The “id” associated with the REA. This is included in the link for the desired REA to be deleted.

### *Output:*

Deletes the REA with the given id. Returns string with the message:

“Deleted User: [id]”

<http://localhost:8080/rea/{id}/delete-ra/{raId}>

See:

<http://localhost:8080/ra/{id}/delete>

^^^ raId = id ^^^

<http://localhost:8080/rea/{id}/set-name>

### *Input:*

The “id” associated with the REA. This is included in the link for the desired RA.

The “name” to be set for the current REA. This is given as a string in JSON formatting, as seen below.

```
{  
  “name” : “...”  
}
```

### *Output:*

Changes the name of the REA with the given id. Returns string with the message:

“Name Edited”

**http://localhost:8080/rea/{id}/set-email**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The “email” to be set for the current REA. This is given as a string in JSON formatting, as seen below.

```
{  
  "email" : "..."  
}
```

***Output:***

Changes the email of the REA with the given id. Returns string with the message:

“Email Edited”

**http://localhost:8080/rea/{id}/set-gender**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The “gender” to be set for the current REA. This is given as a string in JSON formatting, as seen below.

```
{  
  "gender" : "..."  
}
```

***Output:***

Changes the gender of the REA with the given id. Returns string with the message:

“Gender Edited”

<http://localhost:8080/rea/{id}/set-hall>

***Input:***

The “id” associated with the RA. This is included in the link for the desired RA.

The “hall” to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "hall" : "..."  
}
```

***Output:***

Changes the hall of the RA with the given id. Returns string with the message:

“Hall Edited”

<http://localhost:8080/rea/{id}/is-ra-clocked-in/{raId}>

***Input:***

The “id” associated with the REA. The “raId” associated with the RA. These are included in the link.

***Output:***

Returns all Boolean indicated whether the given RA is clocked in. Returns string of the boolean, as seen below.

```
“[boolean]”  
}
```

<http://localhost:8080/rea/{id}/is-ra-enabled/{raId}>

***Input:***

The “id” associated with the REA. The “raId” associated with the RA. These are included in the link.

***Output:***

Returns all Boolean indicated whether the given RA account is enabled. Returns string of the boolean, as seen below.

```
“[boolean]”  
}
```

<http://localhost:8080/rea/{id}/enable>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

***Output:***

Enables the account of the REA with the given id.

<http://localhost:8080/rea/{id}/enable-ra/{raId}>

See:

<http://localhost:8080/ra/{id}/enable>

^^^ raId = id ^^^

**<http://localhost:8080/rea/{id}/disable>**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

***Output:***

Disables the account of the REA with the given id.

**<http://localhost:8080/rea/{id}/disable-ra/{raId}>**

See:

<http://localhost:8080/ra/{id}/disable>

^^^ raId = id ^^^

**<http://localhost:8080/rea/{id}/set-floor>**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The “floor” to be set for the current REA. This is given as a string in JSON formatting, as seen below.

```
{  
  "floor" : "..."  
}
```

***Output:***

Changes the floor of the REA with the given id. Returns string with the message:

“Floor Edited”

**http://localhost:8080/rea/{id}/set-timezone**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The “timezone” to be set for the current REA. This is given as a string in JSON formatting, as seen below.

```
{  
  "timezone" : "..."  
}
```

***Output:***

Changes the floor of the REA with the given id. Returns string with the message:

“Timezone Edited”

**http://localhost:8080/rea/{id}/set-all**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

All basic attributes to be set for the current REA. This is given as a string in JSON formatting, as seen below.

```
{  
  "name" : "...",  
  "email" : "...",  
  "gender" : "...",  
  "hall" : "...",  
  "enabled" : "...",  
  "floor" : "..."  
}
```

***Output:***

Sets basic attributes REA with the given id. Returns string with the message:

“Basic Attributes Set”

<http://localhost:8080/rea/{id}/create-account>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

Minimum number of attributes to be set for the current REA. This is given as a string in JSON formatting, as seen below.

```
{  
  “name” : “...”,  
  “email” : “...”,  
  “enabled” : “...”  
}
```

***Output:***

Sets minimum number of attributes to create an REA account with the given id. Returns string with the message:

“Basic Attributes Set”

**http://localhost:8080/rea/{id}/create-welcome-message**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The welcome message to be set for the current REA. This is given as a string in JSON formatting, as seen below.

```
{  
  “message” : “...”  
}
```

***Output:***

Sets welcome message for an REA account with the given id. Returns string with the message:

“Welcome Message Created”

**http://localhost:8080/rea/{id}/get-welcome-message**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

***Output:***

Gets welcome message for an REA account with the given id. Returns string with the message:

“[message]”

**http://localhost:8080/rea/{id}/delete-welcome-message**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

***Output:***

Deletes welcome message for an REA account with the given id. Returns string with the message:

“Welcome Message Deleted”

**http://localhost:8080/rea/{id}/add-ra/{raId}**

***Input:***

The “id” associated with the REA. The new “raId” to be added. These are included in the link for the desired RA.

***Output:***

Adds the RA with the raId to the REA with the given id. Returns string with the message:

“RA Added: [raId]”

**http://localhost:8080/rea/{id}/remove-ra/{raId}**

***Input:***

The “id” associated with the REA. The new “raId” to be removed. These are included in the link for the desired RA.

***Output:***

Removes the RA with the raId to the REA with the given id. Returns string with the message:

“RA Removed: [raId]”

**http://localhost:8080/rea/{id}/get-ras**

***Input:***

The “id” associated with the REA. These are included in the link for the desired RA.

***Output:***

Gets the RAs that belong to the REA with the given id. Returns string array with the raids formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{  
  "raId" : "..."  
}
```

**http://localhost:8080/rea/{id}/assign-shifts**

***Input:***

The “id” associated with the REA. This is included in the link for the desired RA.

***Output:***

Assigns shifts created by the REA to their RAs in the order that they are stored. Returns string with the message:

“Shifts Assigned”

**<http://localhost:8080/rea/{id}/assign-shifts-randomly>**

***Input:***

The “id” associated with the REA. This is included in the link for the desired RA.

***Output:***

Assigns shifts created by the REA to their RAs in the order that they are randomly stored as. Returns string with the message:

“Shifts Assigned”

**<http://localhost:8080/rea/{id}/assign-shifts-automatically>**

***Input:***

The “id” associated with the REA. This is included in the link for the desired RA.

***Output:***

Assigns shifts created by the REA to their RAs based on the RA’s competition of that type of shift as well as the total number of shifts they have completed. Returns string with the message:

“Shifts Assigned”

<http://localhost:8080/rea/{id}/shift-complete/{raId}>

***Input:***

The “id” associated with the REA. The “raId” associated with the RA. These are included in the link for the desired RA.

The “dutyLevel” of the event completed by the RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "dutyLevel" : "..."  
}
```

***Output:***

Increments the counter of the RA for the number of “dutyLevel” shifts they have completed. Returns string with the message:

“Added Complete Shift to [raId]”

<http://localhost:8080/rea/{id}/ra-primary/{raId}>

***Input:***

The “id” associated with the REA. The RA associated with the “raId”. These are included in the link for the desired RA.

***Output:***

Returns the number of primary shifts completed by the RA. Returns string with the message:

“Number of Primary Shifts Completed: [#]”

**http://localhost:8080/rea/{id}/ra-secondary/{raId}**

***Input:***

The “id” associated with the REA. The RA associated with the “raId”. These are included in the link for the desired RA.

***Output:***

Returns the number of secondary shifts completed by the RA. Returns string with the message:

“Number of Secondary Shifts Completed: [#]”

**http://localhost:8080/rea/{id}/ra-tertiary/{raId}**

***Input:***

The “id” associated with the REA. The RA associated with the “raId”. These are included in the link for the desired RA.

***Output:***

Returns the number of tertiary shifts completed by the RA. Returns string with the message:

“Number of Tertiary Shifts Completed: [#]”

**http://localhost:8080/rea/{id}/ra-stats/{raId}**

***Input:***

The “id” associated with the REA. The RA associated with the “raId”. These are included in the link for the desired RA.

***Output:***

Returns the total number of shifts completed by the RA. Returns string with the message:

“Total Shifts Completed: [#]”

***Input:***

The “id” associated with the REA. The “raId” for the associated RA. These are included in the link for the desired RA.

***Output:***

Gets events that have been requested to be dropped by the RA with the given id. Returns string array with the raids formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{  
  "eventId" : "..."  
}
```

**http://localhost:8080/rea/{id}/ra/{raId}/deny-drop/{eventId}**

***Input:***

The “id” associated with the REA. The “raId” for the associated RA. The “eventId” to be denied. These are included in the link for the desired RA.

***Output:***

Returns the shift drop denied by the RA. Returns string with the message:

“Drop Denied for Event: [eventId]”

<http://localhost:8080/rea/{id}/ra/{raId}/delete-shift/{eventId}>

***Input:***

The “id” associated with the REA. The “raId” for the associated RA. The “eventId” to be deleted. These are included in the link for the desired RA.

***Output:***

Deletes the event with “eventId” and returns all the shifts of the RA with the given id. Returns string array with the shifts formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
  "eventId" : "...",
  "title" : "...",
  "description" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "..."
}
```

<http://localhost:8080/rea/{id}/create-shift/{eventId}>

***Input:***

The “id” associated with the REA. The “eventId” to be created. This is included in the link for the desired REA.

The new shift to be added for the current REA. This is given as a string in JSON formatting, as seen below.

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
  "endMinute" : "...",
  "endMonth" : "...",
  "endDay" : "...",
  "endYear" : "...",
  "endTimezone" : "...",
  "dutyLevel" : "...",
  "availability" : "..."
}
```

***Output:***

Outputs all the current shifts belonging to the REA with the given id. Returns string with the message:

For String[0], ..., String[n] =>

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
```

```
"endMinute" : "...",  
"endMonth" : "...",  
"endDay" : "...",  
"endYear" : "...",  
"endTimezone" : "...",  
"dutyLevel" : "...",  
"availability" : "..."  
}
```

<http://localhost:8080/rea/{id}/get-events>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

***Output:***

Returns all the events of the REA with the given id. Returns string array with the events formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "..."
}
```

<http://localhost:8080/rea/{id}/get-shifts>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

***Output:***

Returns all the shifts of the REA with the given id. Returns string array with the shifts formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "..."
}
```

<http://localhost:8080/rea/{id}/get-meetings>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

***Output:***

Returns all the meetings of the REA with the given id. Returns string array with the shifts formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...
}
```

<http://localhost:8080/rea/{id}/get-availability/{eventId}>

***Input:***

The “id” associated with the REA. The event associated with the “eventId”. These are included in the link for the desired RA.

***Output:***

Returns the number of spots left to fill the shift created by the REA.  
Returns string with the message:

“[#]”

<http://localhost:8080/rea/{id}/create-event/{eventId}>

***Input:***

The “id” associated with the REA. The “eventId” to be created. This is included in the link for the desired REA.

The new event to be added for the current REA. This is given as a string in JSON formatting, as seen below.

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
  "endMinute" : "...",
  "endMonth" : "...",
  "endDay" : "...",
  "endYear" : "...",
  "endTimezone" : "...",
  "dutyLevel" : "...",
  "availability" : "..."
}
```

***Output:***

Outputs all the current events belonging to the REA with the given id. Returns string with the message:

For String[0], ..., String[n] =>

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
```

```
"endMinute" : "...",  
"endMonth" : "...",  
"endDay" : "...",  
"endYear" : "...",  
"endTimezone" : "...",  
"dutyLevel" : "...",  
"availability" : "..."  
}
```

**<http://localhost:8080/rea/{id}/delete-event/{eventId}>**

***Input:***

The “id” associated with the REA as well as the “eventId” of the event to be deleted. These are included in the link for the desired REA.

***Output:***

Deletes event with the given eventId in the REA with the given id. Returns string with the message:

“Deleted: [eventId]”

**<http://localhost:8080/rea/{id}/delete-event-day>**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The starting “day” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{
"day" : "...
"month" : "...
"timezone" : "...
}
```

***Output:***

Deletes events on starting day in the REA with the given id. Returns string with the message:

“Deleted Day”

<http://localhost:8080/rea/{id}/delete-event-week>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The starting “day” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “year” of the starting day events to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{
"day" : "...
"month" : "...
"year" : "...
"timezone" : "...
}
```

***Output:***

Deletes all events up until a week after the starting day in the REA with the given id. Returns string with the message:

“Deleted Week”

**http://localhost:8080/rea/{id}/delete-event-month**

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “year” of the starting day events to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{  
  "month" : "..."  
  "year" : "..."  
  "timezone" : "..."  
}
```

***Output:***

Deletes all events for the entire month day in the REA with the given id. Returns string with the message:

“Deleted Month”

<http://localhost:8080/rea/{id}/find-ra-in-hall>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{  
  "hall" : "..."  
}
```

***Output:***

Returns an array of the RA ids that match the given hall.  
This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{  
  "raId" : "..."  
}
```

<http://localhost:8080/rea/{id}/find-rea-in-hall>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{  
  "hall" : "..."  
}
```

***Output:***

Returns an array of the REA ids that match the given hall.  
This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{  
  "reaId" : "..."  
}
```

<http://localhost:8080/rea/{id}/find-rec-in-hall>

***Input:***

The “id” associated with the REA. This is included in the link for the desired REA.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{  
  "hall" : "..."  
}
```

***Output:***

Returns an array of the REC ids that match the given hall. This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{  
  "recId" : "..."  
}
```

<http://localhost:8080/rea/{id}/report-ra/{raId}>

***Input:***

The “id” associated with the REA. The new “raId” to be reported. These are included in the link for the desired REA.

***Output:***

Reports the RA with the raId from the REA with the given id. Returns string with the message:

“RA Id: [raId] Reported”

**http://localhost:8080/rea/{id}/false-report-ra/{raId}**

***Input:***

The “id” associated with the REA. The new “raId” to be reported. These are included in the link for the desired REA.

***Output:***

Nullifies the report for the RA with the raId from the REA with the given id. Returns string with the message:

“[raId] Report Nullified”

**http://localhost:8080/rea/{id}/clear-reports-ra/{raId}**

***Input:***

The “id” associated with the REA. The new “raId” to be reported. These are included in the link for the desired REA.

***Output:***

Clear all reports for the RA with the raId from the REA with the given id. Returns string with the message:

“[raId] Reports Reset”

**http://localhost:8080/rea/{id}/report-rea/{reaId}**

***Input:***

The “id” associated with the REA. The new “reaId” to be reported. These are included in the link for the desired REA.

***Output:***

Reports the REA with the reaId from the REA with the given id. Returns string with the message:

“REA Id: [reaId] Reported”

<http://localhost:8080/rea/{id}/report-rec/{recId}>

***Input:***

The “id” associated with the REA. The new “recId” to be reported.  
These are included in the link for the desired REA.

***Output:***

Reports the REC with the recId from the REA with the given id. Returns  
string with the message:

“REC Id: [recId] Reported”

## Resident Education Coordinator Links

<http://localhost:8080/rec/{id}/delete>

### *Input:*

The “id” associated with the REC. This is included in the link for the desired REC to be deleted.

### *Output:*

Deletes the REC with the given id. Returns string with the message:

“Deleted User: [id]”

<http://localhost:8080/rec/{id}/delete-rea/{reaId}>

See:

<http://localhost:8080/rea/{id}/delete>

^^^ reaId = id ^^^

<http://localhost:8080/rec/{id}/delete-ra/{raId}>

See:

<http://localhost:8080/ra/{id}/delete>

^^^ raId = id ^^^

**http://localhost:8080/rec/{id}/set-name**

***Input:***

The “id” associated with the REC. This is included in the link for the desired RA.

The “name” to be set for the current REC. This is given as a string in JSON formatting, as seen below.

```
{  
  "name" : "..."  
}
```

***Output:***

Changes the name of the REC with the given id. Returns string with the message:

“Name Edited”

**http://localhost:8080/rec/{id}/set-email**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The “email” to be set for the current REC. This is given as a string in JSON formatting, as seen below.

```
{  
  "email" : "..."  
}
```

***Output:***

Changes the email of the REC with the given id. Returns string with the message:

“Email Edited”

**http://localhost:8080/rec/{id}/set-gender**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The “gender” to be set for the current REC. This is given as a string in JSON formatting, as seen below.

```
{  
  “gender” : “...”  
}
```

***Output:***

Changes the gender of the REC with the given id. Returns string with the message:

“Gender Edited”

**http://localhost:8080/rec/{id}/set-hall**

***Input:***

The “id” associated with the REC. This is included in the link for the desired RA.

The “hall” to be set for the current RA. This is given as a string in JSON formatting, as seen below.

```
{  
  “hall” : “...”  
}
```

***Output:***

Changes the hall of the RA with the given id. Returns string with the message:

“Hall Edited”

**http://localhost:8080/rec/{id}/is-ra-clocked-in/{raId}**

***Input:***

The “id” associated with the REC. The “raId” associated with the RA. These are included in the link.

***Output:***

Returns all Boolean indicated whether the given RA is clocked in. Returns string of the boolean, as seen below.

```
“[boolean]”  
}
```

**http://localhost:8080/rec/{id}/is-ra-enabled/{raId}**

***Input:***

The “id” associated with the REC. The “raId” associated with the RA. These are included in the link.

***Output:***

Returns all Boolean indicated whether the given RA account is enabled. Returns string of the boolean, as seen below.

```
“[boolean]”  
}
```

**http://localhost:8080/rec/{id}/enable**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

***Output:***

Enables the account of the REC with the given id.

<http://localhost:8080/rec/{id}/enable-ra/{raId}>

See:

<http://localhost:8080/ra/{id}/enable>

^^^ raId = id ^^^

<http://localhost:8080/rec/{id}/disable>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

***Output:***

Disables the account of the REC with the given id.

<http://localhost:8080/rec/{id}/disable-ra/{raId}>

See:

<http://localhost:8080/ra/{id}/disable>

^^^ raId = id ^^^

<http://localhost:8080/rec/{id}/set-floor>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The “floor” to be set for the current REC. This is given as a string in JSON formatting, as seen below.

```
{
  "floor" : "...
}
```

***Output:***

Changes the floor of the REC with the given id. Returns string with the message:

“Floor Edited”

**http://localhost:8080/rec/{id}/set-timezone**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The “timezone” to be set for the current REC. This is given as a string in JSON formatting, as seen below.

```
{  
  "timezone" : "..."  
}
```

***Output:***

Changes the floor of the REC with the given id. Returns string with the message:

“Timezone Edited”

<http://localhost:8080/rec/{id}/set-all>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

All basic attributes to be set for the current REC. This is given as a string in JSON formatting, as seen below.

```
{
  "name" : "...",
  "email" : "...",
  "gender" : "...",
  "hall" : "...",
  "enabled" : "...",
  "floor" : "..."
}
```

***Output:***

Sets basic attributes REC with the given id. Returns string with the message:

“Basic Attributes Set”

**http://localhost:8080/rec/{id}/create-account**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

Minimum number of attributes to be set for the current REC. This is given as a string in JSON formatting, as seen below.

```
{  
  "name" : "...",  
  "email" : "...",  
  "enabled" : "..."  
}
```

***Output:***

Sets minimum number of attributes to create an REC account with the given id. Returns string with the message:

“Basic Attributes Set”

**http://localhost:8080/rec/{id}/create-welcome-message**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The welcome message to be set for the current REC. This is given as a string in JSON formatting, as seen below.

```
{  
  "message" : "..."  
}
```

***Output:***

Sets welcome message for an REC account with the given id. Returns string with the message:

“Welcome Message Created”

**http://localhost:8080/rec/{id}/get-welcome-message**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

***Output:***

Gets welcome message for an REC account with the given id. Returns string with the message:

“[message]”

**http://localhost:8080/rec/{id}/delete-welcome-message**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

***Output:***

Deletes welcome message for an REC account with the given id. Returns string with the message:

“Welcome Message Deleted”

**http://localhost:8080/rec/{id}/add-ra/{raId}**

***Input:***

The “id” associated with the REC. The new “raId” to be added. These are included in the link for the desired RA.

***Output:***

Adds the RA with the raId to the REC with the given id. Returns string with the message:

“RA Added: [raId]”

**http://localhost:8080/rec/{id}/add-rea/{reaId}**

***Input:***

The “id” associated with the REC. The new “reaId” to be added. These are included in the link for the desired REC.

***Output:***

Adds the REA with the reaId to the REC with the given id. Returns string with the message:

“REA Added: [reaId]”

**http://localhost:8080/rec/{id}/remove-ra/{raId}**

***Input:***

The “id” associated with the REC. The new “raId” to be removed. These are included in the link for the desired RA.

***Output:***

Removes the RA with the raId to the REC with the given id. Returns string with the message:

“RA Removed: [raId]”

**http://localhost:8080/rec/{id}/remove-rea/{reaId}**

***Input:***

The “id” associated with the REC. The new “reaId” to be removed. These are included in the link for the desired REC.

***Output:***

Removes the REA with the reaId to the REC with the given id. Returns string with the message:

“REA Removed: [reaId]”

<http://localhost:8080/rec/{id}/get-ras>

***Input:***

The “id” associated with the REC. These are included in the link for the desired RA.

***Output:***

Gets the RAs that belong to the REC with the given id. Returns string array with the raids formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{  
  "raId" : "..."  
}
```

<http://localhost:8080/rec/{id}/get-reas>

***Input:***

The “id” associated with the REC. These are included in the link for the desired REC.

***Output:***

Gets the REAs that belong to the REC with the given id. Returns string array with the raids formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{  
  "reaId" : "..."  
}
```

**<http://localhost:8080/rec/{id}/assign-shifts>**

***Input:***

The “id” associated with the REC. This is included in the link for the desired RA.

***Output:***

Assigns shifts created by the REC to their RAs in the order that they are stored. Returns string with the message:

“Shifts Assigned”

**<http://localhost:8080/rec/{id}/assign-shifts-randomly>**

***Input:***

The “id” associated with the REC. This is included in the link for the desired RA.

***Output:***

Assigns shifts created by the REC to their RAs in the order that they are randomly stored as. Returns string with the message:

“Shifts Assigned”

**<http://localhost:8080/rec/{id}/assign-shifts-automatically>**

***Input:***

The “id” associated with the REC. This is included in the link for the desired RA.

***Output:***

Assigns shifts created by the REC to their RAs based on the RA’s competition of that type of shift as well as the total number of shifts they have completed. Returns string with the message:

“Shifts Assigned”

**http://localhost:8080/rec/{id}/shift-complete/{raId}**

***Input:***

The “id” associated with the REC. The “raId” associated with the RA. These are included in the link for the desired RA.

The “dutyLevel” of the event completed by the RA. This is given as a string in JSON formatting, as seen below.

```
{  
  "dutyLevel" : "..."  
}
```

***Output:***

Increments the counter of the RA for the number of “dutyLevel” shifts they have completed. Returns string with the message:

“Added Complete Shift to [raId]”

**http://localhost:8080/rec/{id}/ra-primary/{raId}**

***Input:***

The “id” associated with the REC. The RA associated with the “raId”. These are included in the link for the desired RA.

***Output:***

Returns the number of primary shifts completed by the RA. Returns string with the message:

“Number of Primary Shifts Completed: [#]”

**http://localhost:8080/rec/{id}/ra-secondary/{raId}**

***Input:***

The “id” associated with the REC. The RA associated with the “raId”. These are included in the link for the desired RA.

***Output:***

Returns the number of secondary shifts completed by the RA. Returns string with the message:

“Number of Secondary Shifts Completed: [#]”

**http://localhost:8080/rec/{id}/ra-tertiary/{raId}**

***Input:***

The “id” associated with the REC. The RA associated with the “raId”. These are included in the link for the desired RA.

***Output:***

Returns the number of tertiary shifts completed by the RA. Returns string with the message:

“Number of Tertiary Shifts Completed: [#]”

**http://localhost:8080/rec/{id}/ra-stats/{raId}**

***Input:***

The “id” associated with the REC. The RA associated with the “raId”. These are included in the link for the desired RA.

***Output:***

Returns the total number of shifts completed by the RA. Returns string with the message:

“Total Shifts Completed: [#]”

***Input:***

The “id” associated with the REC. The “raId” for the associated RA. These are included in the link for the desired RA.

***Output:***

Gets events that have been requested to be dropped by the RA with the given id. Returns string array with the raids formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{  
  "eventId" : "..."  
}
```

**http://localhost:8080/rec/{id}/ra/{raId}/deny-drop/{eventId}**

***Input:***

The “id” associated with the REC. The “raId” for the associated RA. The “eventId” to be denied. These are included in the link for the desired RA.

***Output:***

Returns the shift drop denied by the RA. Returns string with the message:

“Drop Denied for Event: [eventId]”

<http://localhost:8080/rec/{id}/ra/{raId}/delete-shift/{eventId}>

***Input:***

The “id” associated with the REC. The “raId” for the associated RA. The “eventId” to be deleted. These are included in the link for the desired RA.

***Output:***

Deletes the event with “eventId” and returns all the shifts of the RA with the given id. Returns string array with the shifts formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
  "eventId" : "...",
  "title" : "...",
  "description" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "..."
}
```

<http://localhost:8080/rec/{id}/create-shift/{eventId}>

***Input:***

The “id” associated with the REC. The “eventId” to be created. This is included in the link for the desired REC.

The new shift to be added for the current REC. This is given as a string in JSON formatting, as seen below.

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
  "endMinute" : "...",
  "endMonth" : "...",
  "endDay" : "...",
  "endYear" : "...",
  "endTimezone" : "...",
  "dutyLevel" : "...",
  "availability" : "..."
}
```

***Output:***

Outputs all the current shifts belonging to the REC with the given id. Returns string with the message:

For String[0], ..., String[n] =>

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
```

```
"endMinute" : "...",  
"endMonth" : "...",  
"endDay" : "...",  
"endYear" : "...",  
"endTimezone" : "...",  
"dutyLevel" : "...",  
"availability" : "..."  
}
```

<http://localhost:8080/rec/{id}/get-events>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

***Output:***

Returns all the events of the REC with the given id. Returns string array with the events formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
}
```

<http://localhost:8080/rec/{id}/get-shifts>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

***Output:***

Returns all the shifts of the REC with the given id. Returns string array with the shifts formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "..."
}
```

<http://localhost:8080/rec/{id}/get-meetings>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

***Output:***

Returns all the meetings of the REC with the given id. Returns string array with the shifts formatted as string in JSON, as seen below.

For String[0], ..., String[n] =>

```
{
"eventId" : "...",
"title" : "...",
"description" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "...",
"startHour" : "...",
"startMinute" : "...",
"startMonth" : "...",
"startDay" : "...",
"startYear" : "...",
"startTimezone" : "..."
}
```

<http://localhost:8080/rec/{id}/get-availability/{eventId}>

***Input:***

The “id” associated with the REC. The event associated with the “eventId”. These are included in the link for the desired RA.

***Output:***

Returns the number of spots left to fill the shift created by the REC.  
Returns string with the message:

“[#]”

<http://localhost:8080/rec/{id}/create-event/{eventId}>

***Input:***

The “id” associated with the REC. The “eventId” to be created. This is included in the link for the desired REC.

The new event to be added for the current REC. This is given as a string in JSON formatting, as seen below.

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
  "endMinute" : "...",
  "endMonth" : "...",
  "endDay" : "...",
  "endYear" : "...",
  "endTimezone" : "...",
  "dutyLevel" : "...",
  "availability" : "..."
}
```

***Output:***

Outputs all the current events belonging to the REC with the given id. Returns string with the message:

For String[0], ..., String[n] =>

```
{
  "title" : "...",
  "startHour" : "...",
  "startMinute" : "...",
  "startMonth" : "...",
  "startDay" : "...",
  "startYear" : "...",
  "startTimezone" : "...",
  "endHour" : "...",
```

```
"endMinute" : "...",  
"endMonth" : "...",  
"endDay" : "...",  
"endYear" : "...",  
"endTimezone" : "...",  
"dutyLevel" : "...",  
"availability" : "..."  
}
```

**<http://localhost:8080/rec/{id}/delete-event/{eventId}>**

***Input:***

The “id” associated with the REC as well as the “eventId” of the event to be deleted. These are included in the link for the desired REC.

***Output:***

Deletes event with the given eventId in the REC with the given id. Returns string with the message:

“Deleted: [eventId]”

**<http://localhost:8080/rec/{id}/delete-event-day>**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The starting “day” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{
"day" : "...
"month" : "...
"timezone" : "...
}
```

***Output:***

Deletes events on starting day in the REC with the given id. Returns string with the message:

“Deleted Day”

**http://localhost:8080/rec/{id}/delete-event-week**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The starting “day” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “year” of the starting day events to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{
"day" : "...
"month" : "...
"year" : "...
"timezone" : "...
}
```

***Output:***

Deletes all events up until a week after the starting day in the REC with the given id. Returns string with the message:

“Deleted Week”

**http://localhost:8080/rec/{id}/delete-event-month**

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The starting “month” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

The “year” of the starting day events to be deleted. This is given as a string in JSON formatting, as seen below.

The “timezone” of the event to be deleted. This is given as a string in JSON formatting, as seen below.

```
{
"month" : "...
"year" : "...
"timezone" : "...
}
```

***Output:***

Deletes all events for the entire month day in the REC with the given id. Returns string with the message:

“Deleted Month”

<http://localhost:8080/rec/{id}/find-ra-in-hall>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{
  "hall" : "...
}
```

***Output:***

Returns an array of the RA ids that match the given hall.  
This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{
  "raId" : "...
}
```

<http://localhost:8080/rec/{id}/find-rea-in-hall>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{  
  "hall" : "..."  
}
```

***Output:***

Returns an array of the REA ids that match the given hall.  
This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{  
  "reaId" : "..."  
}
```

<http://localhost:8080/rec/{id}/find-rec-in-hall>

***Input:***

The “id” associated with the REC. This is included in the link for the desired REC.

The new “hall” to be searched. This is given as a string in JSON formatting, as seen below.

```
{  
  "hall" : "..."  
}
```

***Output:***

Returns an array of the REC ids that match the given hall. This is given as an array of strings each in JSON formatting, as seen below.

For String[0], ..., String[n] =>

```
{  
  "recId" : "..."  
}
```

<http://localhost:8080/rec/{id}/report-ra/{raId}>

***Input:***

The “id” associated with the REC. The new “raId” to be reported. These are included in the link for the desired REC.

***Output:***

Reports the RA with the raId from the REC with the given id. Returns string with the message:

“RA Id: [raId] Reported”

**http://localhost:8080/rec/{id}/false-report-ra/{raId}**

***Input:***

The “id” associated with the REC. The new “raId” to be reported. These are included in the link for the desired REC.

***Output:***

Nullifies the report for the RA with the raId from the REC with the given id. Returns string with the message:

“[raId] Report Nullified”

**http://localhost:8080/rec/{id}/clear-reports-ra/{raId}**

***Input:***

The “id” associated with the REC. The new “raId” to be reported. These are included in the link for the desired REC.

***Output:***

Clear all reports for the RA with the raId from the REC with the given id. Returns string with the message:

“[raId] Reports Reset”

**http://localhost:8080/rec/{id}/report-rea/{reaId}**

***Input:***

The “id” associated with the REC. The new “reaId” to be reported. These are included in the link for the desired REC.

***Output:***

Reports the REA with the reaId from the REC with the given id. Returns string with the message:

“REA Id: [reaId] Reported”

**http://localhost:8080/rec/{id}/false-report-rea/{reaId}**

***Input:***

The “id” associated with the REC. The new “reaId” to be reported. These are included in the link for the desired REC.

***Output:***

Nullifies the report for the REA with the reaId from the REC with the given id. Returns string with the message:

“[reaId] Report Nullified”

**http://localhost:8080/rec/{id}/clear-reports-rea/{reaId}**

***Input:***

The “id” associated with the REC. The new “reaId” to be reported. These are included in the link for the desired REC.

***Output:***

Clear all reports for the REA with the reaId from the REC with the given id. Returns string with the message:

“[reaId] Reports Reset”

**http://localhost:8080/rec/{id}/report-rec/{recId}**

***Input:***

The “id” associated with the REC. The new “recId” to be reported. These are included in the link for the desired REC.

***Output:***

Reports the REC with the recId from the REC with the given id. Returns string with the message:

“REC Id: [recId] Reported”

**http://localhost:8080/rec/{id}/false-report-rec/{recId}**

***Input:***

The “id” associated with the REC. The new “recId” to be reported. These are included in the link for the desired REC.

***Output:***

Nullifies the report for the REC with the recId from the REC with the given id. Returns string with the message:

“[recId] Report Nullified”

**http://localhost:8080/rec/{id}/clear-reports-rec/{recId}**

***Input:***

The “id” associated with the REC. The new “recId” to be reported. These are included in the link for the desired REC.

***Output:***

Clear all reports for the REC with the recId from the REC with the given id. Returns string with the message:

“[recId] Reports Reset”
